A set for which a topology has been specified is called a topological space (Munkres 2000, p. 76). For example, the set together with the subsets comprises a topology, and is a topological space. Topologies can be built up from topological bases. For the real numbers, a topological basis is the set of open intervals.

Point-set topology Munkres, Topology: a first course. Munkres's book is a wonderful first encounter with topology; in fact it begins slowly enough to be a first encounter with abstract mathematics (after a traditional advanced calculus course). Every abstraction is carefully motivated, and there are tons of examples, pictures, and exercises.

The simplest example of a coordinate system is the identification of points on a line with real numbers using the number line. In this system, an arbitrary point O (the origin) is chosen on a given line. The coordinate of a point P is defined as the signed distance from O to P, where the signed distance is the distance taken as positive or negative depending on which side of the line P lies.
